

## LAB 05

1. You can save 8 different types of content.

Maps are used to create interactive displays of geographic information which allow you to analyze specific features. Apps are web apps that can be created using a map and several other app builders. ArcGIS provides you with several app builders based on the methods used within your data.

2. Map [here](#).

- I utilized the sports venues in LA, homeless count in L.A. (2020), and Median Household Income (2022).
- The sports venues in Los Angeles layer just locates each individual stadium within the city. Homeless Count layer describes the percentage, count, and density of homelessness at a community scale.
- I found [this](#) map to be very interesting! It describes the distance between available hospitals and diabetic patients who rely on medication. The map found that many diabetic patients who rely on insulin live nearby local hospitals.

3. I am the group coordinator. I have overseen what steps we need to take next, creating the website and cleaning data so far. I have tried to set up a few meetings but it has been difficult as my group has not had time. Hopefully this is not the case moving forward.

4. Screenshot of HTML assignment:

## SDSU Geography

**An assignment for BDA 594 Fall 2022**

Click [here](#) for more!

Source code:

```
<!DOCTYPE html>
<html>
  <head>
    <title>
      My First HTML Site - Najah Izquierdo
    </title>
  </head>
  <body>
    <center>
      <h1>
        SDSU Geography
      </h1>
      
      <h2 style="color:red;">

5. [This is the group project website](#). I coded this in HTML and deployed it to Heroku. I know this isn't Wordpress or Google Sites, I hope that's okay! Here is a screen recording of the site:

6. WordPress is a open-source software which utilizes PHP along with MySQL or a database to create websites.
- Wordpress vs. Google Sites
    - WordPress allows for more customization as it allows you to alter features which allows for a more unique site. Google sites only provides you with 13 different templates while WP provides you with hundreds. Another thing I noticed in my time web designing, is the limitations in Plugins and Widgets on Google, it only allows for use of Google Apps.
